

MANTSINEN CLEANING STATION

The Mantsinen Cleaning Station is specially designed for automatic cleaning of wood trucks from tree bark and other debris. It consists of two powerful fans, whose targeted sweeping guarantees an optimal cleaning result, even for cased structures. The standard ISO containers used for the cleaning station are placed on both sides of the truck lane when leaving the woodyard. A radar detects an approaching truck, and the equipment starts automatically, removing the debris safely and easily.

BENEFITS OF THE MANTSINEN CLEANING STATION

SIMPLE SAFETY

Cleaning the truck properly at the wood yard prevents debris spreading onto roads, improves traffic safety and keeps environment tidy. Thanks to the automation, the driver does not have to exit the truck cabin or clean the truck manually. The system also makes cleaning the area easier.

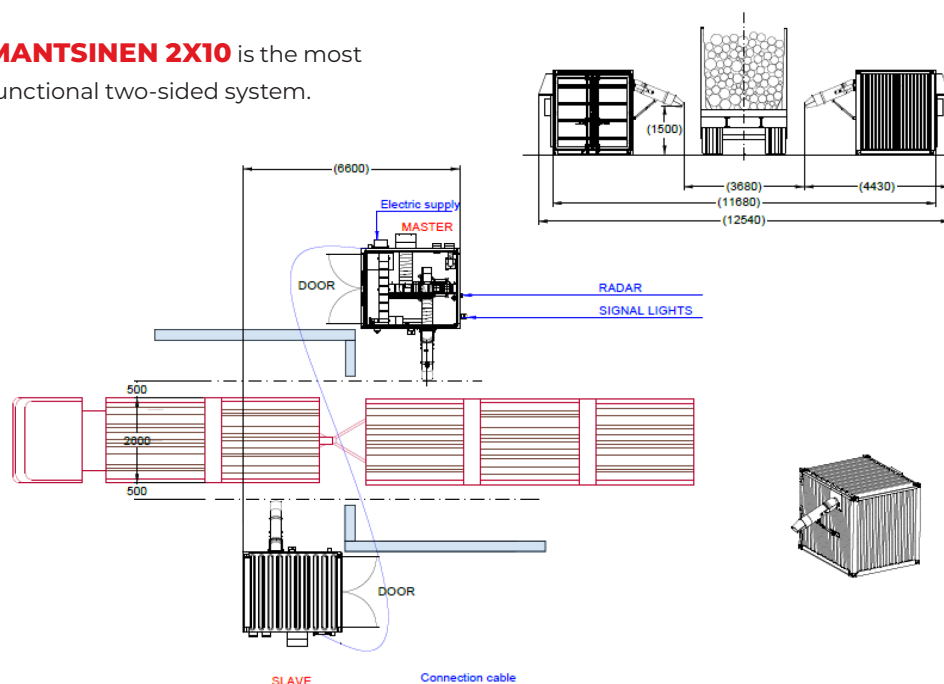

EFFICIENT IN EVERY WAY

Thanks to the Mantsinen Cleaning Station, truck turnaround times are reduced when the equipment takes care of the cleaning instead of manual work. The truck is driven directly through the station when leaving the woodyard and the equipment turns on automatically. In order to save energy, the fans only operate when necessary, but can also be switched to continuous in rush times.

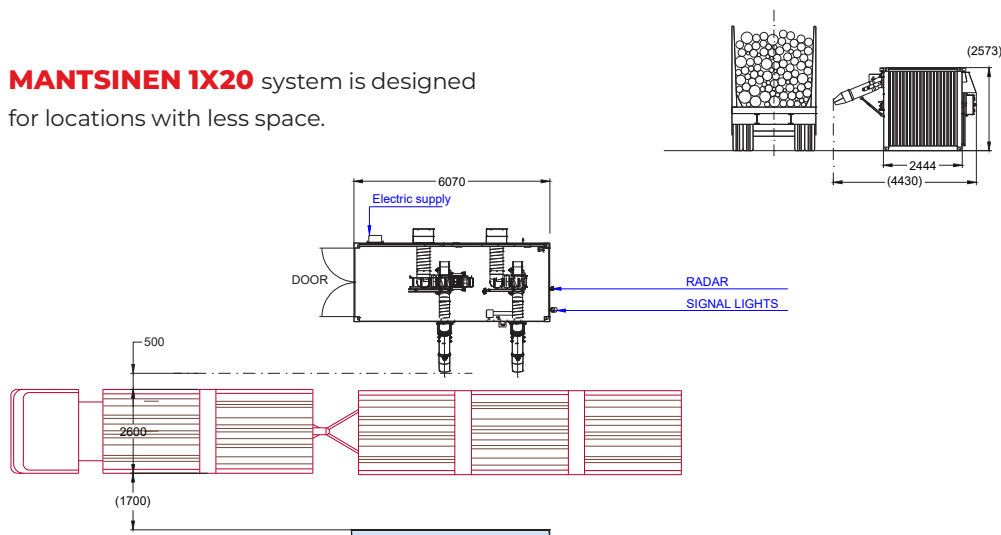

THE MANTSINEN CLEANING STATION IS AVAILABLE IN TWO MODELS.

MANTSINEN 2X10 is the most functional two-sided system.

MANTSINEN 1X20 system is designed for locations with less space.

The equipment is delivered ready for use, except for the on-site electrical wiring.
The electrical design and equipment are in accordance with IEC standards.
